

# FIRENET

---

## Fire Alarm System

The Firenet Virtual Panel (VPanel™) is a software application program that allows you to access, view, and control your fire alarm panel from any Microsoft Windows® based computer.

Connected to the Firenet Fire Alarm System (via a RS232 port) the VPanel™ program provides a dynamic display identical in appearance and operation to the display and controls on the fire alarm panel.

### Benefits

- Vpanel™ provides convenient management by authorised personnel of the entire Firenet fire alarm system.
- Ideal for large multi-panel sites.
- Enables the user to view current system status, alarm history as well as perform operations such as alarm acknowledgement, and zone isolation remote from the fire panel.
